

ABSTRACT OF THE DISCLOSURE

A table cover that allows the user to display literature or product samples in pockets that extend vertically from the edge of the table, comprising a water-resistant and lightweight primary material and a transparent secondary material from which the pockets are made. The pockets can be made either from a single sheet of transparent material or from a plurality of sections of transparent material. The pockets can vary in number and size, and they can be located in one or two rows on one or both sides of the table. In the preferred embodiment, the primary material is nylon ripstop coated with urethane, and the secondary material is clear window plastic. The secondary material can be UV-treated to prevent fading of the literature or other materials contained in the pockets, and text and/or graphics can be superimposed on the front surface of the pockets.
